264 Eating seemed to be casual, and it would be inaccurate to speak of "mealtimes." The time for eating was governed by what one happened to be doing on that day. While a person was in the village, he ate whenever food was offered, which occured frequently. If fishing was in order, the fishermen ate before and after their trip and also took food with them. Quain noticed that people usually ate on arising and, during the planting season, again upon returning from the gardens. Meals, then, were only an intensification of eating, occasioned by the return of people to the village. All the people of a household frequently ate at the same time, but the whole village seldom ate simultaneously. Meals involved little formality, and the Trumaí man often ate in his hammock between naps.

House Building

342 114 Unfortunately, Quain left few detailed drawings of houses or other aspects of material culture, and his descriptions are brief. Most of the data on material culture were gathered from his careful inventory of all the houses in the village. He was probably reserving the detailed documentation for the proposed return trip which he never made.

342 335 The first step in the construction of a house was to sink the two heavy center posts in a deep hole. The ridge pole was then set in place at the top of the center posts by raising it with forked sticks. A few men stood with the sticks at either end of the ridge pole, and each group in turn lifted and set the end on the center posts. A "water-shed" (not well described by Quain but undoubtedly a cap of thatch) was placed over the ridge pole. The tops of the center posts were not notched to receive the ridge pole; instead, sticks were lashed on opposite sides of the two [283] center posts to form a fork in which the ridge pole was laid. All joining of the framework in the house was done with bark fiber. Wall posts, about four feet high, were set in the ground so as to form an elliptical floor plan around the center posts.

The next step was to lash on the curved longitudinal poles which join the wall posts to the ridge pole. Horizontal poles were tied across these and across the wall posts to form a frame for the thatch. Additional smaller poles could be added to give a tighter thatch frame. Thatching was sometimes started in one section before the frame had been entirely completed. The grass (*damok*) for thatch was gathered by the house-builders and brought back tied in bundles.

342 The roof was thatched first, but a section was often left incomplete until the rainy season. Quain was told by Maibu, the chief, that he would finish thatching his house after the rains began because the grass was longer then. In the case of one house, the thatching of the walls was started when the roof was nearly completed. While one builder

SP23 Trumai SP23

was working on the roof, the other thatched the wall facing the forest, and the house was subsequently occupied while work was still proceeding on that wall. The wall toward the village was temporarily hung with cloth drapes for privacy, although for purposes of protection from enemies the opposite side was thatched first. 342

Additional thatch was placed on the house at the beginning of the rainy season. At that time light poles were bound to the frame for greater support. The chief's house began to sag from the weight of the thatch, and braces had to be put under the ridge pole. Two posts, as heavy as the center posts, were crossed just below the ridge pole and bound together. A few men got behind each post and pushed so that the poles would assume a more nearly vertical position and give firmer support to the ridge poles. When this had been accomplished, the bases of the posts were set in holes. 342 335

Quain had the opportunity to observe two houses being constructed: his own and a fifth dwelling being built by two Trumaí men. His own small house took one week to build. The work started off with a great burst of effort, and in four hours all the wall posts, center posts and the ridge pole were in place. However, every day thereafter progress became increasingly slower. 123 342 461

House styles and construction were not rigidly conventionalized. The Trumaí helped build a house for the missionaries, Mr. and Mrs. Thomas Young, and they thought that Quain, being a *kuratiba* (white man), would like one such as the Youngs had designed for themselves. When they were half finished with the frame, Quain realized what was happening, and asked for a haystack house like theirs. The revision was made easily and the result was a hybrid. This, added to the fact that two of the houses in the village were much larger than the other two, indicated a certain flexibility and willingness to imitate. The Kamayurá classified the different posts and poles that went into house building, but the Trumaí had only very broad terms for the corresponding parts. 123 341 [197] [192] [335]

The heavy work of raising the ridge pole, stepping in braces, and carrying and inserting center posts was done cooperatively. These joint labors, although brief and infrequent, made for a festive occasion and gave rise to laughter and gaiety, an unusual thing among the men. With the exception of operations requiring the combined efforts of more men, the house was built by the males who were to occupy it. Women took no part in the building. Yanahi and Mayuva, who were building a new house, shared the work unequally, Yanahi doing the larger part. They did not always work at the same time, and, when they did, they worked on separate sections of the house. 335 342 476 [462]

Quain's house was built cooperatively because he was an outsider, and it was the obligation of the whole community to accommodate him. 123 342 476 574
